

SUSTAINABILITY POLICY

The company policy for sustainability is based on the British standard BES 6001. The following main points of the sustainability policy at Stahlwerk Thüringen GmbH have resulted from the requirements of this standard.

Organisation Management Requirements

Priority is given to a responsible procurement policy and to a legal compliance. For this purpose we continuously operate and improve our Quality Management System and the Operating and Supplier Management Systems.

Supply Chain Management Requirements

We emphasize material retraceability throughout the supply chain. It is important to us that our suppliers work according to the guidelines of health and safety management systems and environmental management systems. We strive for extensive certification of our suppliers.

Sustainable Development Management Requirements

Through investment and further development we have achieved a high standard for the following points:

- Greenhouse gas emissions
- Energy consumption
- Use of resources
- Waste prevention and waste management
- Water consumption or abstraction
- Life Cycle Analysis (LCA)
- Eco-toxicity
- Transport impacts
- Employment and skills
- Neighbouring community
- Company ethics

It is our goal to maintain this high standard we have achieved and to develop this further, whilst taking into account technical and economic possibilities.

The cornerstone of our waste management is to keep the volumes to be disposed on our disposal site and the quantities which are sent, without energy recovery, to an external thermal recycling process, as low as possible.
